Exercise 24-1

1. Display the Tool Palettes window. Float the window if it is docked. Move the window around the screen.

2. Dock the Tool Palettes window on the left or right side. Then, float the window.

3. Right-click on the Tool Palettes window title bar and uncheck Allow Docking in the shortcut menu. Move the window to the far left or right. Notice how the window is not docked.

4. Right-click on the Tool Palettes window title bar and select Transparency in the shortcut menu. Adjust the transparency level to your preference.

5. Turn on the autohide feature. Move your cursor over the title bar and then off the window. Do this a couple of times to get a feel for the delay.

6. Right-click in the Tool Palettes window and select View Options... from the shortcut menu. Pick the Icon only radio button and close the View Options dialog box. Make note of how the tools appear in the palette. Repeat this for the other display options.

7. Anchor the tool palette to the left or the right (Allow Docking must be checked).

8. Move your cursor over the title bar and then off of the window. Do this a couple of times to get a feel for the delay. Notice how this is somewhat a combination of the autohide and docking features.
